by Judith Curry One of the persistent themes in climate science in the past few years has been the lack of understanding of the role of feedbacks in the climate system. We have a better understanding of the dynamics of the system, but have a poor understanding of how the system will respond to external forcing. Perhaps the most important example of this is the subject of sea-level rise. The IPCC AR5 consensus position was that SLR was a future projection. The IPCC AR5 Working Group II report, in Figure 10.4.3, gave a range of SR [sea level rise] of 0.18-0.38 meters by 2100. The IPCC AR5 Working Group II report has been a catalyst for the issue of SLR rising to the status of political football. The Working Group II report was late in being released in February 2013 and much of the political football was kicked off in early 2013. Because of the attention, perhaps people forget how poorly we understand the feedbacks of the climate system, the feedbacks which we are adding to and in which we are engaged. The IPCC AR5 Working Group II report on SLR had a statement, in Figure 10.2.5, that SLR was a future projection, and that there is uncertainty in how fast SLR will actually develop and progress. This issue was raised in the early 1990s, as I recall, by David Skeie, author of The feedbacks of the climate system. Skeie made the point that even if you believe that the climate system is in a self-correcting equilibrium state, that doesn't make the system a black box. The system
