ProCryptum Activation Code is a free online file encryption program that allows users to quickly encrypt and decrypt files without adding complexity or disruption to their standard workflow. Files are encrypted using a key that is generated by accessing the user's email address. The generated file can be sent to any email address in a variety of formats such as PDF, Word, and Excel. Users can then login to ProCryptum at the time of the request and decrypt the file in a couple seconds. Files can be sent to multiple recipients or individually to a single address. Even files sent to a web address will be read by the end recipient. Files are completely private and can be easily restored even if sent to a known email address. It is also possible to encrypt files while accessing them from a USB drive. "ProCryptum" is an application that can encrypt files on a Mac, so that they can only be read by the owner of that file. ProCryptum encrypts all files, and then compresses them, making it very difficult for unauthorized users to recover the original content. However, the file cannot be opened without a password, which can be encrypted with a private key to make it even more difficult for someone to open the file. Imagine you are at a restaurant, and the waiter asks you for your name and address, but before he gives you your change he removes your wallet from his pocket and places it on the table. You start to take your wallet back, but the waiter blocks you and asks you to pay. In that case, it would be much better if the waiter did not take back his wallet, but instead used the same encryption to encrypt your wallet. Likewise, if you ever want to send someone a file, you might encrypt it with ProCryptum, which could only be read when the user has been approved by you, at which point the same user can open the file by decrypting it using a private key. How to use ProCryptum: Now, you can encrypt any file, and when you want to send the encrypted file, you will be asked to enter the password that will protect your file. Then you can safely distribute the file to anyone you wish, and only they can unlock the file with the password that you have given them. The best thing about ProCryptum is that you can encrypt and compress the same file, so you can use it for sending encrypted files, or compressed files, or even encrypted files.
